$$a = 1,9 \text{ ms}^{-2}$$

$$1.2 F_f = \mu_k F_N, F_N = mg + R_y = 20 \times 9,8 + 17,321 = 213,321 \text{ N}$$

$$12 = \mu_k (213,321)$$

$$\mu_k = 0,0563$$

$$1.3 \Delta x = v_i \Delta t + \frac{1}{2} a \Delta t^2$$

 $F_{\text{weight}} + (-F_T) = ma$
 $(3 \times 9.8) - F_T = 3a$

VERTICAL PROJECTILE MOTION SOLUTIONS

Activity 1

$$1. \quad 1.1 \quad v_f^2 = v_i^2 + 2a\Delta y$$

$$(0)^2 = (4)^2 + 2(-9,8) \Delta y$$

$$0 = 16 + (-19,6) \Delta y$$

$$-16 = -19,6 \Delta y$$

$$\therefore \Delta y = 0,81 \text{ m}$$

1.2

$$v_f = v_i + a \Delta t$$

$$0 = (-4) + (9,8) \Delta t$$

$$\Delta t = 0,41 \text{ s}$$

\therefore The ball takes 0,41 s to reach the highest point in its projection (5)

1.3.

Time upwards = time downwards

\therefore total time in the air is

$$(2)(0,41) = 0,82 \text{ s}$$

1.4. Total displacement = $\Delta y = 0 \text{ m}$ (1)

Displacement is measured in a straight line from the initial position (the thrower's line from the original to the final position (the thrower's hand is the initial and final position)).

Activity 2

$$2.1 \quad 3 - 2,04 = 0,96 \text{ s}$$

2.2

Option 1

$$\begin{aligned}\Delta y &= v_i \Delta t + \frac{1}{2} a \Delta t^2 \\ &= (10)(3) + \frac{1}{2}(-9,8)(3)^2 \\ &= 14,1 \text{ m}\end{aligned}$$

$\Delta y = 14,1$ m below the starting point

$$v_f^2 = v_i^2 + 2a\Delta y$$

$$0 = 100 + 2(-9,8)\Delta y$$

$$\Delta y = 5,1 \text{ m}$$

Maximum height above the ground = $5,1 + 14,1 = 19,2$ m

Option 2

$$\begin{aligned}\Delta y &= v_i \Delta t + \frac{1}{2} a \Delta t^2 \\ &= 0 + \frac{1}{2}(-9,8)(3 - 1,02) \\ &= -19,21 \text{ m}\end{aligned}$$

$\Delta y = 19,21$ m (maximum height above the ground)

Option 3

$$v_f^2 = v_i^2 + 2a\Delta y$$

$$(-19,4)^2 = 0 + 2(-9,8)\Delta y$$

$\Delta y = 19,2$ m (maximum height above the ground)

Activity 3

1. $15 \text{ m}\cdot\text{s}^{-1}$

(1)

2. Inelastic collision

The speed/velocity at which the ball leaves the floor is less / different than that at which it strikes the floor OR The speed/velocity of the ball changes during the collision.

Therefore, the kinetic energy changes/is not conserved.

(2)

$$3 \quad v_f^2 = v_i^2 + 2a\Delta y$$

$$(20)^2 = (10)^2 + 2(9,8)\Delta y$$

$$\therefore \Delta y = 15,31 \text{ m}$$

(3)

Displacement from floor to maximum height

$$v_f^2 = v_i^2 + 2a\Delta y$$

$$(0)^2 = (-15)^2 + 2(9,8)\Delta y$$

$$\Delta y = -11,48 \text{ m}$$

Total displacement

$$= -11,48 + 15,31$$

$$= 3,82 \text{ m or } 3,83 \text{ m}$$

Activity 4

4.2 A

4.3 C

MOMENTUM & IMPULSE

Activity 1

- 1.1 Momentum is defined as the product of mass and velocity of an object.
- 1.2 Impulse is the product of the net force and the time in which the net force acts on an object.
- 1.3 Elastic collision is defined as collision in which the kinetic energy is conserved.
- 1.4 Inelastic collision is defined as collision in which the kinetic energy is not conserved.
- 1.5 Principle of conservation of linear momentum it states that the total linear momentum of an isolated system remains constant.
- 1.6 An isolated system is the one on which the net external force acting on the system is zero.

Activity 2

2.1

Diagram A:

$$m = 150 \div 1000 = 0,15 \text{ kg}$$

$$v_i = +18 \text{ m}\cdot\text{s}^{-1}$$

$$v_f = -12 \text{ m}\cdot\text{s}^{-1}$$

Diagram B:

$$m = 0,15 \text{ kg}$$

→

$$v_i = +18 \text{ m}\cdot\text{s}^{-1}$$

→

$$v_f = 0 \text{ m}\cdot\text{s}^{-1}$$

Let the direction towards the wall be positive

$$m = 150 \text{ g} = 0,15 \text{ kg (divide the mass by 1000)}$$

$$v_i = 18 \text{ m}\cdot\text{s}^{-1}$$

$$p_i = mv_i$$

$$= (0,15)(18)$$

$$= 2,7 \text{ kg}\cdot\text{m}\cdot\text{s}^{-1} \text{ towards the wall}$$

2.2

$$m = 150 \text{ g} = 0,15 \text{ kg}$$

$$v_f = -12 \text{ m}\cdot\text{s}^{-1}$$

$$P_f = mv_f$$

$$= (0,15)(-12)$$

$$= 1,8 \text{ kg}\cdot\text{m}\cdot\text{s}^{-1} \text{ away from the wall}$$

2.3

$$m = 0,15 \text{ kg}$$

$$\Delta p = mv_f - mv_i$$

$$= (0,15)(-12 - 18)$$

$$= -4,5 \text{ kg}\cdot\text{m}\cdot\text{s}^{-1}$$

$\therefore \Delta p$ is $4,5 \text{ kg}\cdot\text{m}\cdot\text{s}^{-1}$ away from the wall

2.4

$$\begin{aligned} \text{Diagram A: } F_{\text{net}} &= \frac{\Delta p}{\Delta t} \\ &= \frac{MV_f - MV_i}{\Delta t} \\ &= \frac{(0,15)(-12) - (0,15)(+18)}{0,1} \end{aligned}$$

\therefore Force exerted by the wall is 45 N away from the wall

$$\begin{aligned} \text{Diagram B } F_{\text{net}} &= \frac{\Delta p}{\Delta t} \\ &= \frac{mv_f - mv_i}{\Delta t} \\ &= \frac{0,15(0) - 0,15(18)}{0,1} \\ &= -27 \text{ N} \end{aligned}$$

\therefore Force exerted by the wall is 27N away from the wall

2.5 $p_f = -1,8 \text{ kg}\cdot\text{m}\cdot\text{s}^{-1}$ away from the wall

$p_i = +2,7 \text{ kg}\cdot\text{m}\cdot\text{s}^{-1}$ toward the wall

$$\begin{aligned} \Delta p &= m_{vf} - m_{vi} \\ &= -1,8 - (+2,7) \\ &= -4,5 \text{ kg}\cdot\text{m}\cdot\text{s}^{-1} \end{aligned}$$

$$\begin{aligned} F_{\text{net}}\Delta t &= \Delta p \\ &= (0,175) [(-30) - (12)] = -7,35 \text{ N}\cdot\text{s} \end{aligned}$$

Therefore 7,35 N·s away from the bat (4)

2.

$$\begin{aligned} F_{\text{net}} \Delta t &= -7,35 = F_{\text{net}} (0,05) \\ \therefore F_{\text{net}} &= \frac{-7,35}{0,05} = -147 \text{ N} \end{aligned}$$

Therefore 147 N away from the bat (3)

3. 147 N towards the bat. According to Newton's Third Law of Motion the force of the bat on the ball is equal to the force of the ball on the bat, but in the opposite direction, (5)

$F_{\text{bat on ball}} = -F_{\text{ball on bat}}$

Activity 4

4.1 An isolated system is the one on which the net external force acting on the system is zero.

4.2

$$m_1 = 4\,000 \text{ kg} \quad \text{and} \quad m_2 = 3\,000 \text{ kg} \quad v_{1i} = +1,5 \text{ m}\cdot\text{s}^{-1} \quad v_{2i} = 0 \text{ m}\cdot\text{s}^{-1}$$

$$v_{1f} = ? \quad v_{2f} = +2,8 \text{ m}\cdot\text{s}^{-1}$$

$$\Sigma p_i = \Sigma p_f$$

$$m_1 v_{1i} + m_2 v_{2i} = m_1 v_{1f} + m_2 v_{2f}$$

$$(4000)(1,5) + (3000)(0) = (4000)v_{1f} + (3000)(2,8)$$

$$4000 v_{1f} = 6000 - 8400$$

$$v_{1f} = 0,6 \text{ m}\cdot\text{s}^{-1}$$

$\therefore 0,6 \text{ m}\cdot\text{s}^{-1}$ to the west

4.3

$$\begin{aligned} \Sigma E_{Ki} &= \frac{1}{2} m_1 v_{1i}^2 + \frac{1}{2} m_2 v_{2i}^2 \\ &= \frac{1}{2} (4000)(1,5)^2 + \frac{1}{2} (3000)(0)^2 \\ &= 4500 + 0 \\ &= 4500 \text{ J} \end{aligned}$$

$$\begin{aligned} \Sigma E_{Kf} &= \frac{1}{2} m_1 v_{1f}^2 + \frac{1}{2} m_2 v_{2f}^2 \\ &= \frac{1}{2} (4000)(0,6)^2 + \frac{1}{2} (3000)(2,8)^2 \\ &= 720 + 11760 \\ &= 12480 \text{ J} \end{aligned}$$

$$4500 \text{ J} \neq 12480 \text{ J}$$

\therefore Collision is inelastic

2.1.1 The minimum frequency (of a photon/light) needed to emit electrons from (the surface of) a metal. (substance)

OR

The frequency (of a photon/light) needed to emit electrons from (the surface of) a metal. (substance) with zero kinetic energy. (2)

2.1.2 Silver

Threshold/cutoff frequency (of Ag) is higher

OR

To eject electrons with the same kinetic energy from each metal, light of a higher frequency/energy is required for silver. Since $E = W_0 + E_k(\text{max})$ (and E_k is constant),

the higher the frequency/energy of the photon/light required, the greater is the work function/ W_0 . (3)
